ketties, from which the lead is syphoned into face moids to make 100-pound pigs placed on trucks, weighed and consigned to the railroad cars for shipment. The drossing plant also is couloped with a Howard press.

The forchearths used for the biast furnaces are mounted on wheels and are of especial design and of extra large type of construction. The overflow from the forehearths passes directly into the slag pots of 30 cubic feet capacity, then trammed to the tapping pit, where they are allowed to stand and cool before tapping. These then are tapped into large receiving slag pots having a capacity of 22 tons, which are allowed to stand and cool before tapping. These then are tapped into large receiving slag pots having a capacity of 22 tons, which are allowed to stand until filled, then trammed to the dumpling face of the main siag dump. The company has a dump slope 275 feet in height, an item of importance in reducing to the minimum slag dump troubles.

The matte is tapped from the forehearths into pans of 1½ tons capacity, trammed to the breaking platform, where it is removed by jib cranes and either stored or gravitated into railroad cars.

Stack and Baghouse.

Stack and Baghouse.

Stack and Baghouse.

The chimney is 200 feet high, 12 feet in diameter at the top, being constructed of brick. This accommodates the sintering plant and blast furnace gases after passing through the baghouse. The blast furnace gases are conveyed from the furnaces to the haghouse fan by means of a steel fine. The fan is of the Sirocco type, electric motor driven and gases thence are discharged directly into the brick flue connected with the baghouse burning chambers by means of circular openings, the valves of which are controlled from the exterior. This is so arranged that any one of the chambers may be cut out to permit cleaning out of the accumulated fume and sinter.

There are 1008 bags in the baghouse, each is inches in diameter and 32 feet in length. The burning chamber is divided into seven compartments. The thimble floor and roof trestles are of steel, everything else being of brick construction. The baghouse burning floors are arranged with ventilated cooling chambers underneath to eliminate trouble of spontaneous combustion. The bag cleaning process is mechanical throughout, consisting of a reversed air current system. In case of necessity the baghouse can be closed and the gases discharged directly up the chimney by a series of by-pass flues.

Company's Own Design.

Company's Own Design.

The entire plant was designed by the engineers of the company, including all the steel, stack, brick and baghouse work. These engineers built all the steel flues, steel flues to the baghouse and stack the forehearths and slag pots, drossing kettles, blast furnace crucibles, blast furnace and sintering plant charge cars and electric locomotives, with the exception of the motors. The smelter is confined within a comparatively small area, guaranteeing against loss of unity and motion, yet with ample elbow-room. The cost of installation will reach well to the nyllion-dollar mark.

In connection with the smelter is a very complete hospital under the canstant care of Mr. Robinson, this accessory being maintained entirely at company expense without any monthly contributions of employees, any and all of whom have access to the hospital in case of meed.

The smelter construction and opera-

whom have access to the hospital in case of need.

The smelter construction and operation is under the charge of General Superintendent H. N. Thomson: L. T. Sicka, designing and construction engineer: G. E. Stannard, field engineer: R. B. Swaner, chief draughtsman: Edward Cuddehay, master mechanic, and Joseph Jette, foreman mason. To the first two mentioned, and to H. M. Smith, of rare kedak experinese, the writer desires to express his appreciation of the counteous treatment received at their hands a few days 320.

HOW WATERS-PIERCE CASH WAS EXPENDED

ST. LOUIS, Mo., March 2.-M. M. Van Buren of New York, son-in-law of John D. Archbold, will be called as a witness in the Standard Oil-Waters-Pierce legal fight for control of the Waters-Pierce Oil company when the taking of testimony is resumed before Special Commissioner Jesse McDonald March 15. No hearing was held today because of absent wit-

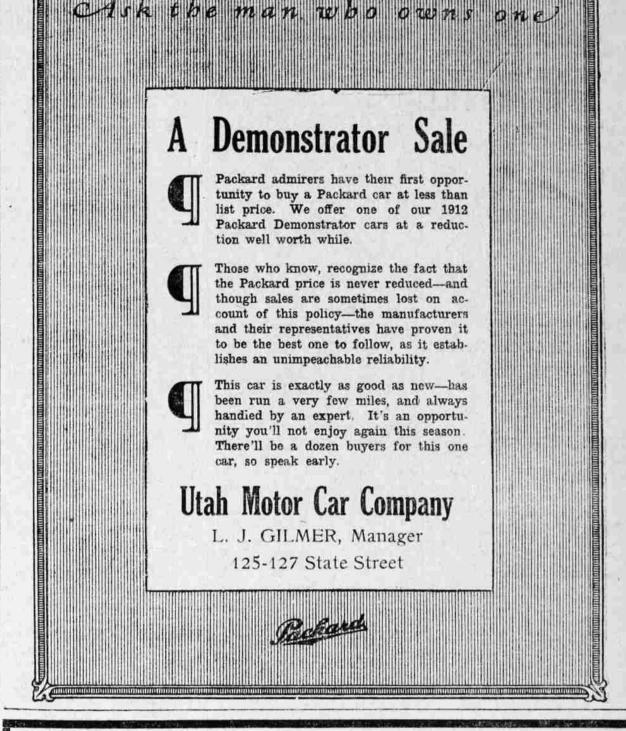

The Pierce interests alleged that through Van Buren, Archbold and others are seeking to control the Waters-Pierce company and operate it as part of a new combine. Testimony of C. M. Adams, former secretary of the Waters-Pierce company, who is recognized as a Standard Oil man, showed that the Waters-Pierce Company, who is recognized as a Standard Oil man, showed that the Waters-Pierce Oil company in the last six years paid as lines and atterneys fees a antirust litigation \$2,823,000.

The attorneys fees amounted to \$828,000 and the fines were paid in Texas, Okinboma, Arkansas and Missouri.

AMERICAN BOYS TO TOUR BRITISH ISLES

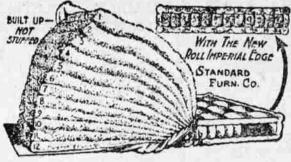

WASHINGTON, March 2.-Plans for tour of England, Ireland and Scotland a tour of England, Ireland and Scotland by several hundred American boys during the summer eneation this year are being made by Cal. H. Livingstone, the head of the boy scouts in the United States. It is proposed to send the boys over, accompanied by competent scout masters and physicians as soon as the schools close. The vomesters will be drawn from all parts of the country, and if a sufficient number will make the trip a steamer will be charteted.

The plan also contemplates a trip to the United States by British boys on the same steamer. Mr. Lavingstone was encouraged to attempt this undertaking by the marked success of the recent American tour of Australian boy scouts.
